Notes: See Table 1 notes for sample description. Each cell within a panel displays estimates of the impact of baseline automatic-zero EFC eligibility on the specified outcome, scaled per additional \$1,000 in baseline grant aid. Column headings represent the number of years since baseline. All models also include controls for a linear term in distance from the AGI threshold (allowed to vary on either side of the threshold). Robust standard errors, clustered by initial institution by entry cohort, are in parentheses. "Mean | ineligible" represents the limit of the expected value of the dependent variable as the AGI threshold is approached from above the threshold. All dollar amounts are adjusted for inflation (2013 dollars).
