

Figure A5: Effect of exposure to elite peers on student outcomes by socioeconomic background

Notes: This graph plots the marginal effect of an increase in P_{-ics} on student outcomes: the probability of enrolling in an elite degree; overall high school GPA; high school teacher assessment and high school written exams. The coefficients are estimated from regression Equation 1. See notes to Table 2 for details of the specification. The low SES sample is defined as the group of students who have at least one parent with no more than the compulsory level of education, but no parent with an elite education. The high SES sample is defined as the group of students who have at least one parent with a post-secondary education, but no parent with a compulsory level of education. The medium SES sample defines households with the education in between - where no parent left school at the compulsory age and no parent has an elite education.
