

Figure 1: Density of earnings percentiles by education level

Notes: This graph plots the density of earnings percentiles across educational groups. Sample is the population of Norway aged 28-40 between 1993-2001. The percentile rank of earnings is calculated within each birth cohort.

Figure 2: Intergenerational mobility: estimating the percentile rank-rank correlation across exposure to elite peers

Notes: This graph plots the fitted values from an intergenerational mobility rank-rank regression allowing for the interaction between exposure to elite peers and the parent percentile rank to be quadratic. High (low) exposure is defined as above (below) mean proportion of elite peers in the high school cohort.
