

Table 2: Effect of elite peers on the probability of enrolling in an elite degree

	(1) Full sample	(2) Low SES	(3) High SES
Proportion of parents with elite degree (std)	0.026*** (0.003)	0.013*** (0.003)	0.040*** (0.008)
<i>Number of students</i>	<i>177,219</i>	<i>58,328</i>	<i>20,018</i>
<i>Number of schools</i>	<i>556</i>	<i>524</i>	<i>459</i>

Notes: OLS estimates of a regression of an indicator for whether the student is enrolled in an elite degree within 6 years of starting high school on: the proportion of parents with elite degree in the student's school's cohort, student's gender, middle school GPA, an indicator for whether the student was born in Norway, mother and father's highest education level, a variable measuring the number of student's own parents who have an elite education, and an indicator for whether the student's family income is in the top decile of the overall income distribution. Regressions include cohort and school fixed effects. Column (1) reports the coefficient on the proportion of parents with an elite degree estimated in the full sample, column (2) and column (3) report the same coefficient estimated in the low SES and high SES samples, respectively. The low SES sample is defined as the group of students who have at least one parent with no more than the compulsory level of education, but no parent with an elite education. The high SES sample is defined as the group of students who have at least one parent with an elite degree, but no parent with a compulsory level of education. Regressions are weighted by school size to take account of the parent peer variables group averages, taken from groups of different sizes. Standard errors clustered at the school level. *** p<0.01, ** p<0.05, * p<0.1
