

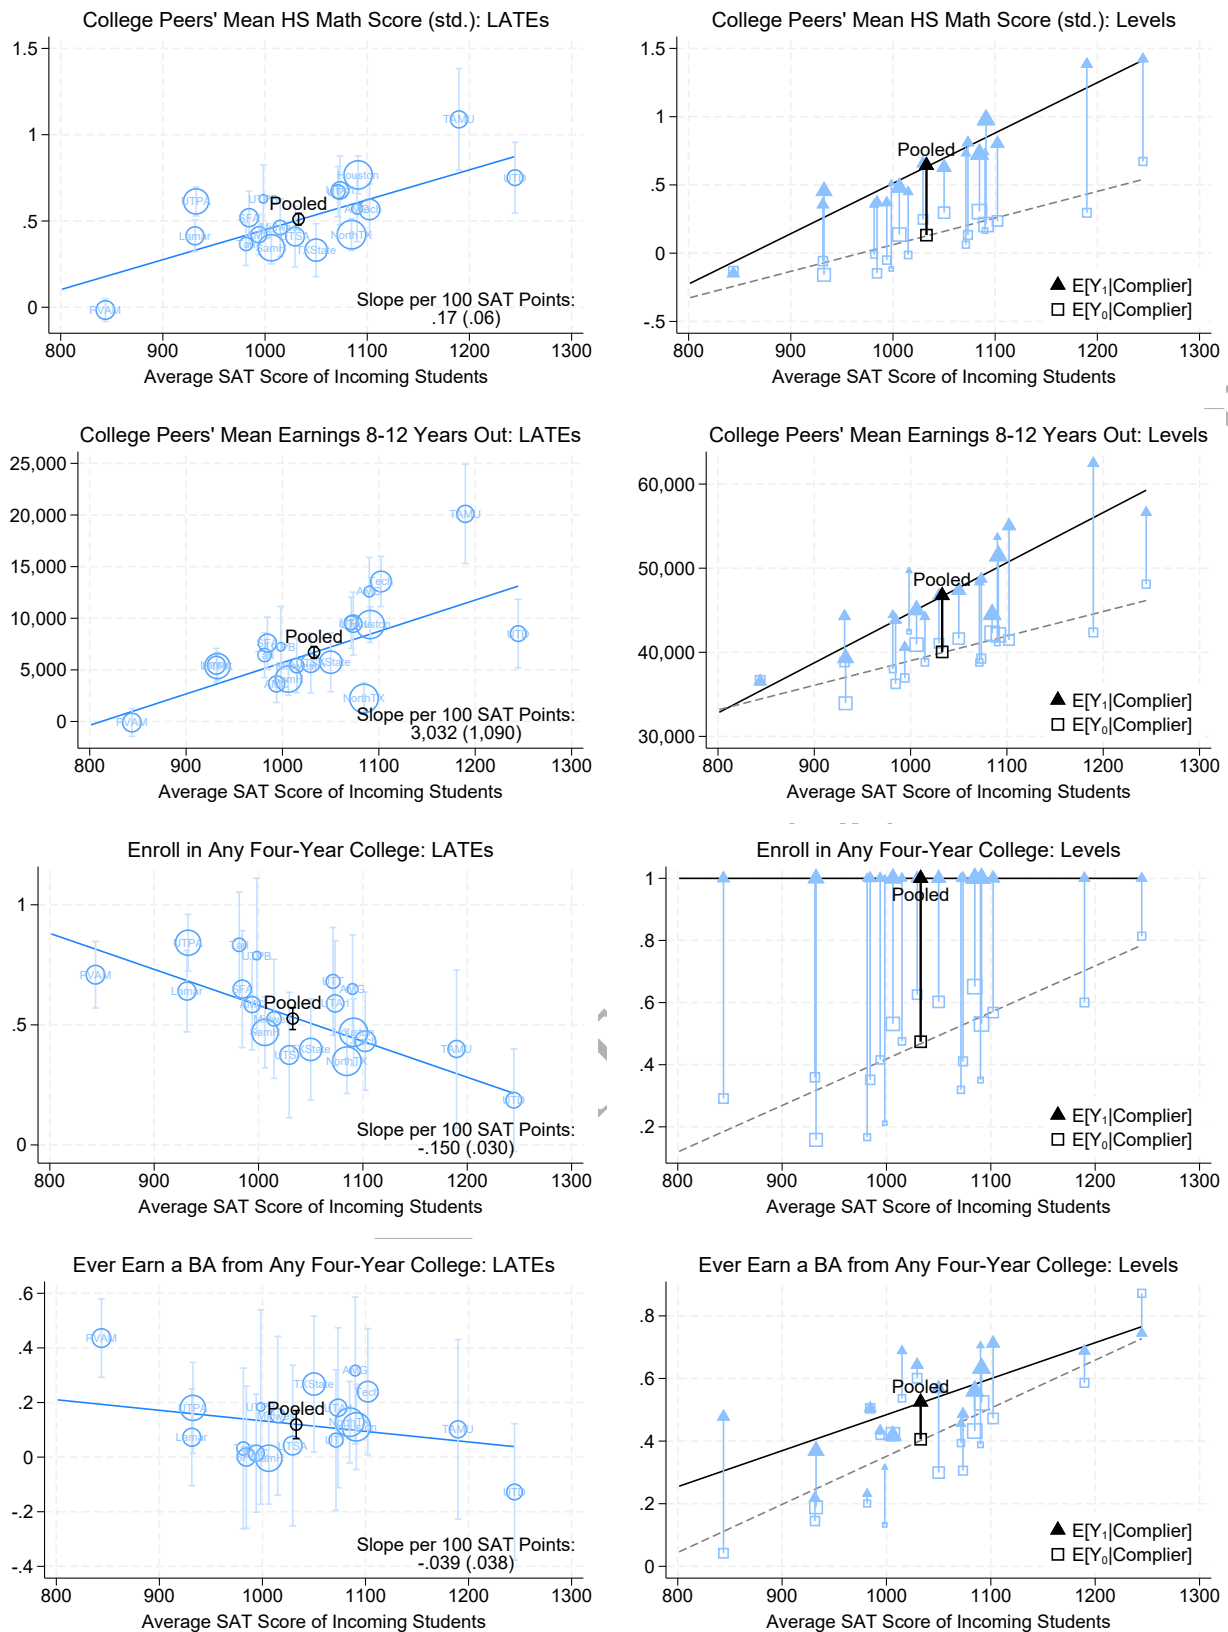

Figure 11: Across Institutional Selectivity: Effects on Peer Quality and Educational Attainment

Notes: The darker “Pooled” estimate reproduces the pooled LATEs from Section 3, while the lighter estimates are LATEs for each target university estimated separately using the main specification in Section 2.4. The diagonal line is the estimated linear relationship between an institution’s LATE (left plots) or potential outcome levels (right plots) and its selectivity. Estimates for the smallest institutions are not plotted due to their large CIs, but those institutions are included in the pooled estimates and slopes.
